The Lubrication Solution for Industrial Robots

STATE OF THE ART LUBRICATION SYSTEMS FOR INDUSTRIAL ROBOTS

• The system greases every point while the robot is in operation and maintains a constant barrier at bushings preventing dust and dirt from entering wear surfaces.

• Increased safety as there is no need to crawl under or over equipment to service hard-to-reach lubrication points.

• Avoid costly repairs and downtime. How long can your robot be down before your bottom line is impacted?

Adding a Bijur Delimon lubrication system increases equipment life by decreasing wear on vital components. Automatic lubrication systems safely and continuously supply lubricant while your machine is running.

MultiPort II

The MultiPort Lubricator is an electrically driven multiple outlet lubrication unit designed primarily for use with progressive divider valve systems to accurately control the amount of grease and to monitor system performance via an integral controller.

PVBM Progressive Valve

The corrosion resistant PVBM Divider Valve dispenses lubricant to as many as 20 outlet lines at operating pressures up to 3600 psi. This compact valve can be located near the lube points to accurately dispense grease automatically to the entire machine. Valves are available with cycle indicator pins to provide visual confirmation of system operation. In addition, the cycle pin can be fitted with a switch to provide electrical feedback to a system controller.
